

Rational and design:

The design for my currency is a card. Since carrying around money in note or coin form is becoming increasingly less popular this plastic card is designed to replace all of that. The QR code located on one side of the card acts as a way to check one's balance without needing to log onto a banking app. The details located on the left side of the card act as basic information that allows sales staff, banks and police to check against other ids to see if the card is stolen. In the centre is a spinning holographic that is designed to make it hard to produce or make fake cards with other people QR codes. Along the bottom left of the card is a randomised trip of lines special to each user, like the QR code, that act as the scannable barcode allowing for purchase by using both swipe and scan methods. Finally to make the card more aesthetically pleasing the left side has a coloured strip which can be one of a few colours.
